EDUCATION

University of California, San Diego

Bachelor of Science in Computer Science & Engineering

GPA: 3.2

Sep. 2023 – June 2027

La Jolla, CA

Relevant Coursework: Data Structures, Design & Analysis of Algorithms, Discrete Mathematics, Theory of Computation, Database System Principles, Large Codebases, Online Database Analytics & Applications

TECHNICAL SKILLS

Languages: Java, Python, C/C++, Assembly, HTML, CSS, JavaScript, TypeScript, SQL

Frameworks & Libraries: FastAPI, Flask, Express, scikit-learn, SQLAlchemy, NumPy, Pydantic, JWT, bcrypt, React, Axios, Tailwind CSS, Socket.IO, Chart.js, SQLite

Developer Tools: Git, Docker, AWS, PostgreSQL, Nginx, Apache, Linux, VS Code, Kaggle

EXPERIENCE

Association for Computing Machinery (ACM)

AI Competitions Team

May 2025 – Present

Remote

- Reduced full tournament evaluation time from ~**11 hours** to ~**20 minutes** by designing a parallelized game orchestration system using **Python** multiprocessing, distributing **79,600** game evaluations across **32 worker processes** for a **32× speedup**.
- Architected an inverted-control evaluation pipeline using **Flask** HTTP services and a central game orchestrator, enabling language-agnostic bot submissions while maintaining complete game state isolation and eliminating turn-order race conditions.
- Containerized a multi-service ML competition platform using **Docker**, deploying isolated bot environments and a central game orchestrator to evaluate **200+** competitor submissions without cross-bot interference or shared state.

Acting Connect

Startup Software Engineering Intern

July 2024 – Sep. 2024

Remote

- Reduced message delivery latency by **60%** by architecting a real-time **WebSocket** communication layer using **Socket.IO**, replacing polling with bidirectional connections for notifications and direct messages between actors and producers.
- Accelerated feature delivery by **30%** by driving **Agile** development workflows across 1-week sprints, translating product owner requirements into user stories and acceptance criteria that directly informed API design and WebSocket event contracts.

PROJECTS

The Fray | *Python, FastAPI, PostgreSQL, scikit-learn, React, Axios*

Personalized News Recommendation App – www.thefraynews.com

May 2025 – Present

- Improved article recommendation relevance by ~**35%** by implementing a **KNN** collaborative filtering model with **scikit-learn**, training on user interaction vectors (clicks, read-time, saves) to surface personalized feeds across **50+ active users**.
- Modeled and managed a relational **PostgreSQL** schema with **SQLAlchemy** ORM, designing normalized tables for users, articles, and interaction history to support efficient personalized feed queries.
- Implemented token-based authentication including signup, login, and protected route middleware using **JWT** and **bcrypt** password hashing, eliminating server-side session state entirely.
- Deployed a production web application on **Nginx** with **SSL** termination, serving **100+ concurrent users** with zero-downtime configuration on a **Linux** VPS.

Sales Dashboard | *Node.js, Express, SQLite, Chart.js, Apache*

Full-Stack Analytics Dashboard

Jan. 2026 – Mar. 2026

- Structured a **Node.js + Express** web application using the **MVC** design pattern, cleanly separating routing, business logic, and data access layers to improve scalability and maintainability while enabling independent testing of each component.
- Reduced data interpretation time by ~**40%** by replacing static HTML tables with interactive **Chart.js** visualizations, enabling real-time filtering and drill-down across sales KPIs without full page reloads.
- Configured an **Apache** HTTP Server with structured access log pipelines, capturing per-request metadata to surface traffic patterns, peak usage windows, and session analytics across dashboard users.
